[Introductions and meeting overview @ 0:00](#)

Carter introduced the group members and their backgrounds, noting they would discuss individual ontology projects, Common Core Ontology topics, and planning future meetings. John joined to learn applied ontology.

[Discussion of ontology modeling concepts like GDC, SDC, and information content entities @ 12:53](#)

Adam explained GDCs depend on but can exist without other entities, unlike SDCs. Debate focused on distinguishing processes, GDCs describing them, and information about them.

[Debate over whether patterns of behavior are processes, GDCs, or information content entities @ 48:17](#)

Viewpoints differed on whether patterns of behavior were processes occurring, GDCs describing recurring processes, or information we have due to interest in patterns. The nature of the topic encompasses all three perspectives.

[Example of how eating chopsticks could be modeled as a process, pattern, or information and the relationship between these perspectives @ 54:33](#)

Adam's habit of rubbing chopsticks exemplified the intertwined nature of a recurring process, its description, and our information about it. The group agreed distinctions require considering what information is about in the real world.
